the motivation for the research that is described in these volumes is the wish to explain things in terms of their underlying causes rather than merely being satisfied with phenomenological descriptions when this reductionist approach is applied to information processing it allows the internal structure of information to be analysed so information processing algorithms can then be derived from first principles one of the simplest examples of this approach is the diagonalisation of a data covariance matrix there are many variants of this basic approach such as singular value decomposition in which the assumed independent components of high dimensional data are identified and extracted the main limitation of this type of information analysis approach is that it is based on linear algebra applied globally to the data space so it is unable to preserve information about any local data structure in the data space for instance if the data lives on a low dimensional curved manifold embedded in the data space then only the global properties of this manifold would be preserved by global linear algebra

methods in practice data whose high dimensional structure is non trivial typically lives on a noisy version of a curved manifold so techniques for analysing such data must automatically handle this type of structure for instance a blurred image of a point source is described by its underlying degrees of freedom i e the position of the source and as the source moves about it generates a curved manifold that lives in the high dimensional space of pixel values of the sampled image the basic problem is then to deduce the internal properties of this manifold by analysing examples of such images a more challenging problem would be to extend this analysis to images that contain several overlapping blurred images of point sources and so on there is no limit to the complexity of the types of high dimensional data that one might want to analyse these methods then need to be automated so that they do not rely on human intervention which would then allow them to be inserted as components into information processing networks the purpose of the research that is described in these volumes is to develop principled information processing methods that can be used for such analysis self organising information processing networks arise naturally in this context in which ways of cutting up the original manifold into simpler pieces emerge automatically

data fusion mathematics theory and practice offers a comprehensive overview of data fusion df and provides a proper and adequate understanding of the basic mathematics directly related to df this new edition offers updated chapters alongside four new chapters that are based on recent research carried out by the authors including topics on machine learning techniques target localization using a network of 2d ground radar thermal imaging sensors for multi target angle only tracking and multi sensor data fusion for a single platform and team platforms this book also covers major mathematical expressions formulae and equations and where feasible their derivations it discusses signed distance function concepts df models and architectures aspects and methods of types 1 and 2 fuzzy logics and related practical applications in addition the authors cover soft computing paradigms that are finding increasing applications in multi sensory df approaches and applications this text is geared toward researchers scientists teachers and practicing engineers interested in and working in the multi sensor data fusion area

this textbook provides a comprehensive introduction to the concepts and idea of multisensor data fusion it is an extensively revised second edition of the author s successful book multi sensor data fusion an introduction which was originally published by springer verlag in 2007 the main changes in the new book are new material apart from one new chapter there are approximately 30 new sections 50 new examples and 100 new references at the same time material which is out of date has been eliminated and the remaining text has been rewritten for added clarity altogether the new book is nearly 70 pages longer than the original book matlab code where appropriate we have given details of matlab code which may be downloaded from the worldwide web in a few places where such code is not readily available we have included matlab code in the body of the text layout the layout and typography has been revised examples and matlab code now appear on a gray background for easy identification and advanced material is marked with an asterisk the book is intended to be self contained no previous knowledge of multi sensor data fusion is assumed although some familiarity with the basic tools of linear

algebra calculus and simple probability is recommended although conceptually simple the study of multi sensor data fusion presents challenges that are unique within the education of the electrical engineer or computer scientist to become competent in the field the student must become familiar with tools taken from a wide range of diverse subjects including neural networks signal processing statistical estimation tracking algorithms computer vision and control theory all too often the student views multi sensor data fusion as a miscellaneous assortment of different processes which bear no relationship to each other in contrast in this book the processes are unified by using a common statistical framework as a consequence the underlying pattern of relationships that exists between the different methodologies is made evident the book is illustrated with many real life examples taken from a diverse range of applications and contains an extensive list of modern references
